

CmpE 322 Project 1 Project Report

I used Macintosh Platform and CLion Ide to write my project. I used C++11 and used the generated CMakeLists and CMake files

I used the definition.txt and other code.txt files on the ../ of the src folder. The test ones should be put there. I generated both output.txt and standard output for the project output.

It should run at any computer that has GCC/G++ Compiler. It should be running without a problem after anyone imports, builds and runs the project.

I added the pthread library to the CmakeLists.txt

I also added the argument from the CLion Ide, it shouldn't be problem for the assistants to run the code as normal

I implemented 2 threads a Client and Server as the Project stated with the required locks, waits and unlocks at the critical parts.
